The Waterfall Method is a means of software development which focuses on logical progression through steps. Within the Waterfall method, the next phase of development cannot be started until the previous phase has been completed. Because of this, the Waterfall method is commonly described as rigid. The more flexible and fast growing method of development is known as Agile Methodology. This Agile method is known for its incremental progression and is less focused on one single project. This method divides the development lifecycle into a series of 'sprints' which can be analyzed and responded to throughout the entire developmental process. The Waterfall method is linear while the Agile method is more continuous.
